

NEW RECORD OF *DOLICHOPODA* FROM NORTHERN IRAN
(Orthoptera, Rhaphidophoridae)

CLAUDIO DI RUSSO and MAURO RAMPINI (*)

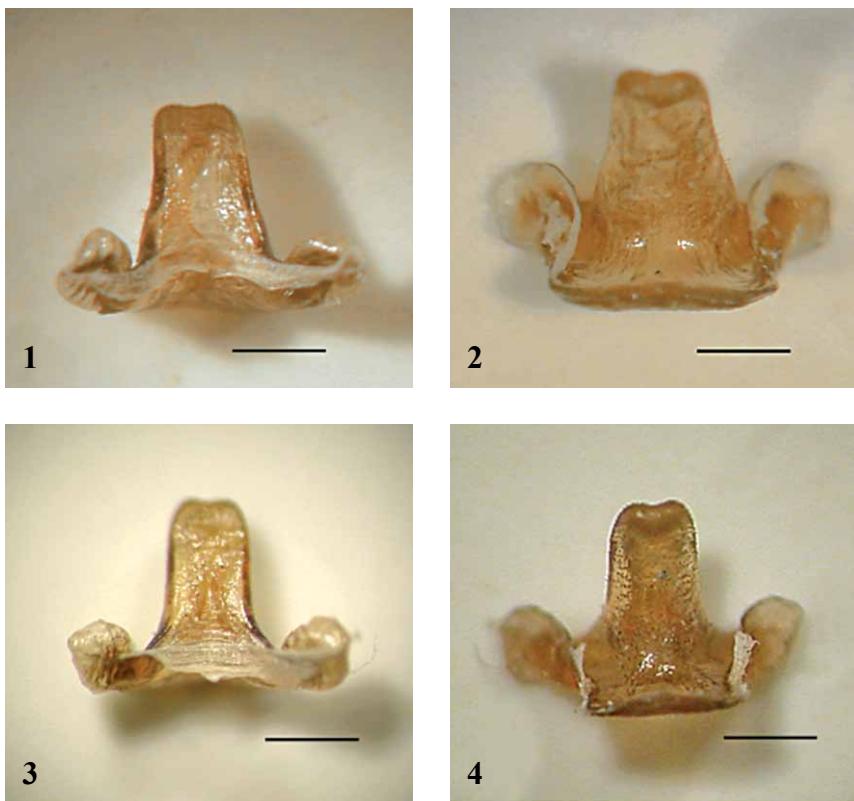

The genus *Dolichopoda* Bolivar, 1880 (subfamily Dolichopodinae) inhabits caves and in some cases epigean habitats of Southern Europe and Asia Minor including to date a total of 51 species (Eades et al. 2012). This genus is mainly widespread in the Mediterranean area from the Pyrenees to the Caucasus (Baccetti 1982, Di Russo & Sbordoni 1998); its diversity in terms of species richness peaks in Southern and South Eastern Europe (Mediterranean basin, Apennines, Balkan and Peloponnesus). In the Caucasian area, only two species of *Dolichopoda* are known thus far: *D. euxina* Semenov, 1901 described from some specimens collected in two caves of the western slopes of the Caucasus, in the Suchumi district (Georgia), and *D. hyrcana* Bey-Bienko, 1969, from the Lenkoran (Talysh) district in eastern Transcaucasia. A third species, *D. noctivaga* Di Russo & Rampini, 2007 is widespread in caves and epigean habitats in Northern Turkey throughout the Black Sea region (Taylan et al. 2011). In this note we report the record of a new sample of *Dolichopoda* from Northern Iran. The morphological study of this material allowed us to attribute the collected specimens to *Dolichopoda hyrcana* (figs 1-4), whose geographic distribution now extends eastwards to the Caspian region of Iran.

***Dolichopoda hyrcana* Bey-Bienko, 1969**

MATERIAL EXAMINED: Northen Iran, Alborz Mts., Chalus region, 23-30.VIII.2009, 1800-2500 m a.s.l., V. Gurko leg., 14 ♂♂, 25 ♀♀, 15 nymphs.

All the specimens were collected on the Northern slopes of Alborz Mts. at an altitude ranging between 1800 and 2500 m a.s.l. This area is

Figs 1-4 – Comparison of epiphallus shape in *Dolichopoda hyrcana* Bey-Bienko, 1969: male from North Iran, dorsal view (1), ventral view (2); male from Lenkoran (Azerbaijan; type locality), dorsal view (3), ventral view (4). Scale bar: 2 mm

covered by the Hyrcanian forest, composed mostly of deciduous species, forming a narrow arc from Talish in the Republic of Azerbaijan to the northern slopes of the Alborz Mountains in North Iran (Akhani et al. 2010). As found for *D. euxina* and *D. noctivaga* from Caucasus and Turkish black sea region (Taylan et al. 2011), presence of *D. hyrcana* appears strongly associated with thermo-mesophilous forest formations, that for their particular bioclimatic conditions (i.e high amount of annual precipitations and high percentages of air humidity) could represent a primary ecological habitat for this species.

ACKNOWLEDGMENTS. We are very indebted to Paolo Fontana (Casalino di Pergine Valsugana, Trento) that provided us the samples object of this note.

SUMMARY

The record of a new sample of *Dolichopoda* from Northern Iran is reported. The morphological study of this material allowed the authors to attribute the studied specimens to *D. hyrcana* Bey-Bienko, 1969, whose geographic distribution now extends eastwards to the Alborz Mountains in North Iran.

RIASSUNTO

Un nuovo campione di *Dolichopoda* proveniente dall'Iran settentrionale è stato studiato dagli autori. Lo studio morfologico di tale materiale ci ha permesso di attribuire questi campioni alla specie *D. hyrcana* Bey-Bienko, 1969, che quindi estende il suo areale verso oriente, dall'Azerbaijan meridionale ai Monti Alborz in Iran.
